

Lex Propositum

Lex Propositum is a decentralized platform for groups of individuals to pool resources and skills in order to create world changing projects. It will close the competitive gap between solo devs and big companies to make this world truly decentralized.

The Problem

Did you ever pitch an idea to the people around you just to be told something like:

"It's a good idea! But to make it real you would need a lot of time because you don't have a team. Also since you have no money to hire people, you have no other choice than doing it alone. Then the chances are pretty high that some big tech companies will already have this product fully developed and running when you're done. So this project is just not going to happen."

In other words, the idea is good, you just can't do it alone.

Too often in this new decentralized ecosystem, some brilliant and talented people are forced to give up on world changing projects because their situation doesn't allow them to be competitive in the market. On the other hand, this situation happens to thousands of people every week and if we could all come together and work towards a common goal, we could easily make ourselves a place in the market.

The problem I see; we don't have any organization nor system to find and agree on these common goals and are therefore stuck in what I would like to call, a modern and decentralized version of the Byzantine Generals Problem. Where, instead of having generals commanding troops against a city, we have individuals commanding their aptitudes and skills against each other. Clearly just like the generals in the allegory, without a consensus mechanism and a common goal, it will be extremely difficult, even almost impossible for any of us to get ahead of the others, succeed, defeat the already organized companies and finally change the world.

The solution

In order to solve this problem, we need Lex Propositum, a platform where individuals can trade skills, knowledge and time in exchange for part ownership of a project.

It will be built on a decentralized and autonomous consensus mechanism by which the members do projects proposals and skills offering.

It will be filled by a community of developers, technology enthusiasts and entrepreneurs, where everyone has the equal right to propose ideas and contribute to projects. Once populated with enough active members, we will see an array of active project proposals and there will be enough skills demanded for everyone to find a role, either as a dev, content writer, advisor or any other skill necessary to the competition of a project.

The platform in its final form will reinvent the way people invest in a project by giving individuals an opportunity to invest their aptitudes instead of always only risking their hard earned money.

Motivation

Before launching the Lex Propositum I took the time to discuss with actual solo devs and ask about their projects. One thing I did realize and motivated me to create this platform is; most projects even if they have a certain particularity that makes them unique, are not very different from one another. That is why I believe a consensus mechanism could take some of the small or incomplete proposed projects and group them in bigger and more complex projects with greater chances of success.

For example, how many people are launching new coins on the ethereum or binance blockchain?.. A lot! Many of these tokens are basically the same functionality and features but wrapped in a different name and image. How many of these will not be successful because they lack just some little details like visual content for the marketing or a good selling pitch on their website ?.. A lot! I hope we can all agree that, without any major sacrifice of individual particularity brought by the founders, some of these almost complete crypto coins projects could consent to a common ground and become one truly complete, relevant and competitive project.

Finally, most of us creators want the same things.. Those making a social network want it to be used worldwide. The ones making a crypto want it to become relevant. The game makers want their game to be played. You see the pattern, in other words, we simply want our project to succeed! And that's why we are taking risks and investing our precious time. So now let's all stop running around in every direction because alone we will probably all fail. With Lex Propositum, we can all come together, take the time we need to discuss and consent on common ideas and then work together to change the world!

Roadmap

This roadmap is subject to change as the platform development progresses.

First, building a community. (Writing the paper)

Second, publish the official white paper.

Third, alpha release of the platform.

Fourth, decentralization.

Finally, full release.

Community

List of official Lex Propositum community chats and groups. This is a place for the community to discuss the platform and start meeting other future users. If you have any questions, this is also the best place to ask them. Come join us!
